Application for Junior Cybersecurity Position

Dear Hiring Manager

I am applying for a junior cybersecurity opportunity in which I can combine practical security training with nearly three years of technical troubleshooting experience in a banking environment. In my current role at Capitec Bank, I monitor and troubleshoot ATM and coin-machine incidents, coordinate with branches and second-line support teams, and communicate clearly while managing time-sensitive faults. This experience has strengthened the structured analysis, documentation and incident communication required in security work.

I completed the HyperionDev Cybersecurity Bootcamp with a 97% overall task average and am currently preparing for CompTIA PenTest+. Through authorised labs and TryHackMe learning paths, I have practised reconnaissance, network enumeration, vulnerability scanning, web application testing, reverse shells and Linux privilege escalation. I have used Nmap, Burp Suite, Metasploit, Nessus, Wireshark, Splunk SIEM and Kali Linux, and I document findings with practical remediation recommendations.

My portfolio includes controlled SQL injection and cross-site scripting exercises, Metasploitable and Mr Robot lab work, packet-analysis practice and Python projects. I am also developing CWS Academy, a cybersecurity learning platform that uses Firebase Authentication and Firestore for protected student access, assessments and progress tracking. The project has helped me connect security concepts with the design and operation of a working web application.

I would value the opportunity to contribute dependable technical support, careful analysis and a strong learning mindset to your security team. I am particularly interested in junior cybersecurity analyst, SOC, vulnerability management and penetration-testing roles where I can continue building practical experience under responsible security processes.

Thank you for considering my application. I would welcome an interview to discuss how my banking-operations experience, technical training and lab work could support your team.

Yours sincerely

Sandiso Mayekiso
